

If I can interject a way to improve the lighting...

I removed my headlight from the shell, took off the rubber thingy,  
removed  
the lightbulb, then washed the inside of the bulb in hot soapy water.  
Before there was a distinct cloudy bluish tint to the inside, and after  
washing, it was gone. To totally dry the bulb out, I put it in the oven  
at  
150 F for an hour or so. Not hot enough to damage anything, and baked  
the  
thing dry. Came out nice & clean, and the visibility was much improved.

Try it, I think you'll like it. ;-)

This might be a good tip for XJCD ver 3...
